#### Measure Domain

## PRIMARY MEASURE DOMAIN

Outcome

The validity of measures depends on how they are built. By examining the key building blocks of a measure, you can assess its validity for your purpose. For more information, visit the <u>Measure Validity</u> page.

### SECONDARY MEASURE DOMAIN

Does not apply to this measure

### Brief Abstract

### **DESCRIPTION**

This measure assesses the percentage of home health care patients who stabilize (i.e., stay the same or don't get worse) in their bathing ability compared to a prior assessment.

The measure identifies patients' ability to safely bathe the entire body in the shower or tub, also considering the type of assistance needed.

#### RATIONALE

Patients need certain physical abilities and capacities (motor skills, symptom relief) to be able to take a bath (or shower). They may need assistance from a person or special equipment, or they may need someone present to assure their safety in accomplishing this activity. Some patients will always need some level of assistance to bathe. A goal for them may be to remain at that level and not worsen to an increased need for assistance. Their physical abilities can be developed or maintained by managing their symptoms or through rehabilitative services. Being able to still bathe themselves, or not need additional help, may be a sign that they are at least maintaining their present level of ability, even though they are not progressing.

Being able to maintain a current bathing ability is important so they stay clean, feel better about themselves, and stay healthy. It is especially important if no informal caregiver is available to help when the home health caregiver is not there or home health care ends.

Most people value being able to take care of themselves. In some cases, it may take more time for them to bathe themselves than to have someone bathe them. But, it is important that home health care staff and informal caregivers encourage patients to be as independent as possible. Home health staff also can evaluate patients' needs for, and teach them how to use, special devices or equipment to help maintain their ability to perform some activities without the assistance of another person.

If patients can maintain their ability to take a bath, even with help, they are more independent, feel better about themselves, and stay more active. This can positively affect their health. Maintaining patients' ability to bathe themselves may help them live independently as long as possible in their own home.

If patients stop taking care of themselves, it may mean that their health has gotten worse. In addition, their health and quality of life may get worse in the future. Some patients will lose function in their basic daily activities even though the home health care agency provides good care.

This is one of 41 OASIS-based measures for which Medicare-certified home health agencies receive performance reports from the Centers for Medicare & Medicaid Services (CMS). The reports cover Medicare and Medicaid adult non-maternity patients and compare each agency's rates to national reference rates and to the agency's own rates in the previous year. The reports provide home health agencies with information they can use to improve quality of care by targeting care practices that influence specific patient functioning and health status, as part of a comprehensive quality improvement approach.

### PRIMARY CLINICAL COMPONENT

Home health care; bathing

### DENOMINATOR DESCRIPTION

Patients with a completed episode of care who were eligible to stabilize in bathing (i.e., were not at the most severely impaired level of health status according to the "Bathing" OASIS\* item)

\*Outcome and Assessment Information Set (OASIS)

### NUMERATOR DESCRIPTION

Patients from the denominator who stabilized (i.e., did not worsen) in bathing compared to a prior assessment

#### Evidence Supporting the Measure

# EVIDENCE SUPPORTING THE CRITERION OF QUALITY

- A formal consensus procedure involving experts in relevant clinical, methodological, and organizational sciences
- One or more research studies published in a National Library of Medicine (NLM) indexed, peer-reviewed journal

#### Evidence Supporting Need for the Measure

### NEED FOR THE MEASURE

Use of this measure to improve performance Variation in quality for the performance measured

External oversight/Medicaid
External oversight/Medicare
Internal quality improvement
Quality of care research

# Application of Measure in its Current Use

CARE SETTING

Home Care

PROFESSIONALS RESPONSIBLE FOR HEALTH CARE

Measure is not provider specific

LOWEST LEVEL OF HEALTH CARE DELIVERY ADDRESSED

Single Health Care Delivery Organizations

### TARGET POPULATION AGE

Age greater than or equal to 18 years

### TARGET POPULATION GENDER

Either male or female

### STRATIFICATION BY VULNERABLE POPULATIONS

Frail elderly

## Characteristics of the Primary Clinical Component

#### INCIDENCE/PREVALENCE

In 2001, about 2.4 million elderly and disabled Americans received care from nearly 7,000 Medicare certified home health agencies.

### EVIDENCE FOR INCIDENCE/PREVALENCE

Medicare use of selected types of long-term care. [internet]. Baltimore (MD): Centers for Medicare & Medicaid Services; 2003 Nov[cited 2004 Nov 24]. [1 p].

Other Medicare providers and suppliers. [internet]. Baltimore (MD): Centers for Medicare & Medicaid Services; 2003 Nov[cited 2004 Nov 24]. [1 p].

# ASSOCIATION WITH VULNERABLE POPULATIONS

Many home health care patients are frail elders with chronic health conditions, functional disabilities, or cognitive impairments. Such patient characteristics are included in the statistical models used to risk adjust home health agency outcome rates for differences in the types of patients served. In addition, the capability exists to derive outcome rates separately for vulnerable populations for comparison with outcome rates for other population groups.

#### Data Collection for the Measure

CASE FINDING

Users of care only

DESCRIPTION OF CASE FINDING

All adult, non-maternity skilled care patients admitted to Medicare-certified home health agencies

DENOMINATOR SAMPLING FRAME

Patients associated with provider

DENOMINATOR INCLUSIONS/EXCLUSIONS

### Inclusions

Patients with a completed episode of care who were eligible to stabilize in bathing (i.e., were not at the most severely impaired level of health status according to the "Bathing" OASIS\* item)

### **Exclusions**

Data collected about patients whose care is paid for entirely by sources other than Medicare or Medicaid, those under the age of 18, those receiving maternity services only, and those receiving only personal care/supportive services are not submitted to the federal government, therefore these types of patients are excluded from this measure. Patients whose status at start of care indicates a nonresponsive level of consciousness or whose episode of home health care ends with death or with a transfer to an inpatient facility (i.e., hospital, rehabilitation facility, nursing home, or hospice) for 24 hours or more are excluded. Patients who have not yet been discharged or transferred to an inpatient facility (incomplete episode of care) are excluded.

# DENOMINATOR (INDEX) EVENT

Therapeutic Intervention

### DENOMINATOR TIME WINDOW

**SCORING** 

Rate

INTERPRETATION OF SCORE

Better quality is associated with a higher score

### ALLOWANCE FOR PATIENT FACTORS

Case-mix adjustment
Risk adjustment method widely or commercially available

## DESCRIPTION OF ALLOWANCE FOR PATIENT FACTORS

To reduce the chance that a home health agency that serves sicker, older, or more frail patients looks worse in the quality measures, the quality measures are risk adjusted. Percentages are adjusted using predicted rates for each agency based on patient characteristics at admission to home health care. For a detailed explanation of risk adjustment please visit Overview of Risk Adjustment and Outcome Measures for Home Health Agency OBQL Reports: Highlights of Current Approaches and Outline of Planned Enhancements.

### STANDARD OF COMPARISON

External comparison at a point in time Internal time comparison

#### Evaluation of Measure Properties

## EXTENT OF MEASURE TESTING

Measure is based on the best research currently available, including testing in a national quality improvement demonstration. For more information, refer to OASIS and Outcome-based Quality Improvement in Home Health Care: Research and Demonstration Findings, Policy Implications, and Considerations for Future Change. Volume 4, OASIS Chronicle and Recommendations.
